

Rapid increase in urban air pollution affects health and productivity

In 2010, a study by the World Bank and the World Health Organization (WHO) found that in 2000, 1.2 billion people lived in cities with air pollution levels that exceeded WHO guidelines. By 2020, this number is projected to reach 2.5 billion. This rapid increase in urban air pollution is expected to have a significant impact on global health and productivity.
